

CSC/CEG 3150 Tutorial

Programming Tips and Tools for Assignment 3

XIAO Zigang
zg Xiao@cse.cuhk.edu.hk

Department of Computer Science and Engineering
The Chinese University of Hong Kong

November 4, 2008

Outline

CSC/CEG
3150
Tutorial

Outline

Tips

Q & A

Acknowledgement

1 Outline

2 Tips

- `getopt`
- `xxd`
- `dd`
- `mkfs`
- `[u]mount`
- `endian`
- `others`

3 Q & A

4 Acknowledgement

Command line argument

CSC/CEG
3150
Tutorial

Outline

Tips

getopt

xrd

dd

mkfs

[u]mount

endian

others

Q & A

Acknowledgement

- Recall that for some command in Linux, e.g. `/bin/ls`
 - `/bin/ls -l -a`
 - `/bin/ls -la`
 - `/bin/ls -la --file-type --color=auto -w 30 /usr /lib`
- We can observe at least three behaviors:
 - It receives multiple arguments
 - There are short arguments and long arguments, which may require a following value or not
 - We can group similar short arguments together

How to handle argument elegantly?

CSC/CEG
3150
Tutorial

Outline

Tips

`getopt`
`xrd`
`dd`
`mkfs`
`[u]mount`
`endian`
`others`

Q & A

Acknowledgement

- Different milestones in Assignment 3 need different input arguments
 - `./Main -i`
 - `./Main -r`
 - `./Main -w`
 - `./Main -a`
 - `./Main -r`
- How do we parse the command-line argument?
 - Hard code it with the help of `strtok`
 - Tedious, different program needs similar parse code
 - We do not want those stuff bother program's main logic
 - Is there any standard way to do it? - `getopt`

argc and argv revisited

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- `int argc` : Number of arguments
 - Including the executable name
- `char * argv[]` : List of arguments
 - Null terminated.
- E.g. `./main -a test -b`
 - `argc = 4`
 - `argv[0] = ./Main`
 - `argv[1] = -a`
 - `argv[2] = test`
 - `argv[3] = -b`
- `argv[4] (=0)` is NULL.

argc and argv example

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

```
#include <stdio.h>
int main(int argc, char * argv[]){
    int arg;
    for(arg = 0; arg < argc ; arg++){
        if('-', == argv[arg][0] )
            printf("Options: %s\n", argv[arg]+1);
        else
            printf("argument %d: %s\n", arg, argv[arg]);
    }
}
```

Listing 1: Use argc and argv to parse arguments

```
$ ./args -i -lr 'hi there' -f main.c
argument 0: args
option: i
option: lr
argument 3: hi there
option: f
argument 5: main.c
```

Listing 2: sample output

getopt

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

```
#include <unistd.h>
int getopt(int argc, char * const argv[], const char * optstring);
extern char * optarg;
extern int optind, opterr, optopt;
```

Listing 3: prototype of getopt

- getopt uses argc, argv as parameters, as well as a string “optstring”
- optstring tells getopt what options should be handled, and which option should follow a value
- If a character is followed by a colon, that means the corresponding option requires an argument
 - optstring = “ab” means your program accepts “-a” and “-b”
 - optstring = “a:b” means your program accepts “-a” and “-b”, and option a requires an argument, which will be stored in “optarg”

Example of getopt

CSC/CEG
3150
Tutorial

Outline

Tips

getopt

xrd

dd

mkfs

[u]mount

endian

others

Q & A

Acknowledgement

```
1 #include <unistd.h>
2 #include <stdio.h>
3
4 int main(int argc, char * argv[]){
5     int opt;
6     while( (opt = getopt(argc, argv, "if:lr")) != -1){
7         switch(opt){
8             case 'i':
9             case 'l':
10            case 'r':
11                printf("Option: %c\n", opt);
12                break;
13            case 'f':
14                printf("filename: %s\n", optarg);
15                break;
16            case ':':
17                printf("Option needs a value\n");
18                break;
19            case '?':
20                printf("Unknown option: %c\n", optopt);
21                break;
22        }
23    }
24    for(; optind < argc; optind++) /* note this */
25        printf("argument: %s\n", argv[optind]);
26    return 0;
27 }
```

Listing 4: Rewritting parser

A few words about `extern`

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- *declare* a variable:
 - `int a;`
- *define* a variable:
 - `int a=0;`
- In functions, the variables we *defined* are allocated in stack.
 - Automatically disappears after function returns.
- The *external variables* are globally accessible.
- “If the program is in several source files, and a variable is defined in *file1* and used in *file2* and *file3*, then *extern* declarations are needed in *file2* and *file3* to connect the occurrences of the variable.”¹
- `optarg, optind, etc.` are defined in `<getopt.h>`
- You may check it in `/usr/include/getopt.h`

¹K&R, The C Programming Language

Some important facts...

CSC/CEG
3150
Tutorial

Outline

Tips

`getopt`
`xrd`
`dd`
`mkfs`
`[u]mount`
`endian`
`others`

Q & A

Acknowledgement

- If an option needs an extra argument, `optarg` associates with it.
- When all the options are processed, `getopt` returns -1
- When an unrecognized option is received, `getopt` returns '?', `optarg` saves this option character
- Actually `getopt` rewrites `argv` array, see code linu 22-23 in Listing 4
- `getopt_long` can handle long arguments
- For more details, ask `man`
 - `man getopt`
 - `man getopt_long`

- Creates a hex dump of a given file or standard input
- In Assignment 3
 - Try `xxd /dev/ram` - Too much output
 - Try `xxd -s 0x40 -l 160 /dev/ram`
 - Start to read at byte 0x40 (= byte 64)
 - Read 160 bytes
- The right column of the printout contains ascii output.
 - `man ascii` to get more detail
- Another tool `hd` can do similar work

```

Listing 5: Sample output of `xxd`

data definition²

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- dd is a common UNIX program whose primary purpose is the **low-level** copying and conversion of **raw data**
- Like most well-behaved commands, dd reads from its standard input and writes to its standard output
- Use **if** and **of** to specify input and output
- Use **bs** and **count** to specify data size(= *bs * count*)
- Example
 - Copies from /dev/zero to ./zeros with 2 blocks, each block counts for 1k bytes.
`$dd if=/dev/zero of=./zeros bs=1k count=2`
 - Copies from /dev/ram0 to ./header with a 512-byte block.
`$dd if=/dev/ram0 of=./header bs=512 count=1`

²History of dd:<http://www.catb.org/jargon/html/D/dd.html>

mkfs and mkfs.vfat utilities

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- Used to build a file system on a device
- It is just a wrapper for specific file system maker, e.g. mkfs.vfat links to mkdosfs
- Example:
`/sbin/mkfs.vfat -v -F 32 -f 2 -S 512 -s 1 -R 32 /dev/ram0`
Formats `/dev/ram0` to a FAT32 file system

`-F` specify FAT size (12,16,32)

`-f` Fat table number

`-S` logical sector size, default is 512B

`-s` sector number per cluster

`-R` number of reserved sectors

Play with disk image

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xxd
dd
mkfs
{u}mount
endian
others

Q & A

Acknowledgement

- All things in UNIX are files...
- You may use the **ramdisk** `/dev/ram[0-9]` to create FAT32 file system³
 - ramdisk is memory mapping to the file, so it is fast
- You may also use a normal file to create FAT32 file system
- # touch a 64MB file

```
$ dd if=/dev/zero of=./fs bs=1M count=64
# format as a FAT32 file system
$ mkfs.vfat ./fs
# Check the signature 0x55 and 0xAA
$ xxd -s 510 -l 22 ./fs
```

³(Ubuntu user might need **sudo** to access them)

Mounting the disk image

CSC/CEG
3150
Tutorial

Outline

Tips

`getopt`
`xrd`
`dd`
`mkfs`
`[u]mount`
`endian`
`others`

Q & A

Acknowledgement

- We have disk image now, so what?

⁴A loop device makes a file accessible as a block device, e.g. hard disk.

Mounting the disk image

- We have disk image now, so what?
- We can mount it to our file system (hierarchy)
- `$ mkdir /mnt/rd`
`$ mount -t vfat -o loop,umask=000 /dev/ram0 /mnt/rd`⁴
- Use `fdisk -l` to list the partition tables of devices in your machine (need root privilege)

⁴A loop device makes a file accessible as a block device, e.g. hard disk.

Syntax of mount

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

```
$ mount -t fstype -o options device dir
```

| | |
|--------|---|
| -t | file system type use ‘‘vfat’’ for FAT32 |
| device | the source device(file) you want to mount |
| dir | the destination directory(mount point) |
| -o | options |

Some useful options are:

| | |
|-------|--|
| umask | the bitmask of the permissions that are not present(000 means anyone can read & write) |
| loop | use a loop device |

Mounting the disk image(cont.)

Figure: Filesystem Hierarchy

Unmounting the disk image

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- We may do the reverse using `umount`
- The `umount` command detaches the file system(s) mentioned from the file hierarchy
- E.g. `/dev/sda1` is mounted on `/usr/local`, and we want to unmount it.
 - `$ umount /usr/local`
 - `$ umount /dev/sda1`
- The first way is more appropriate since device may be mounted on more than one directory

Big endian and little endian

CSC/CEG
3150
Tutorial

Outline

Tips

getopt
xrd
dd
mkfs
[u]mount
endian
others

Q & A

Acknowledgement

- In x86, the data is written in little endian ordering
 - The least significant byte value is at the lowest address
 - The other bytes follow in increasing order of significance
 - E.g. Storage in memory with value = 0x0A0B0C0D
- Numbers will appear in reverse order
- Strings will appear in the expected order

| | | | |
|----|----|----|----|
| 0D | 0C | 0B | 0A |
|----|----|----|----|

Low address → High address

Table: Illustration of endian

Example and codes

CSC/CEG
